A; Title: The complete genome sequence of the hyperthermophilic, sulfate-reducing arch
A; Reference number: A69250; MUID: 98049343
A; Status: preliminary; nucleic acid sequence not shown; translation not shown
A; Molecule type: DNA
A; Residues: 1-145 <KLE> antigen A;Cross-references: GB:AE000997; GB:AE000782; NID:92689320; PIDN:AAB89722.1; PID:9264 C;Superfamily: hypothetical protein AF1526 14; 'n, οĮ S61303

"Transcriptional antitermination in the bgl operon of E. coli is modulated by a specific RNA binding protein.";

cell 67:1153-1163(1990).

-: FUNCTION: MEDIATES THE POSITIVE REGULATION OF THE BETA-GLUCOSIDE (BGL) OPERON BY FUNCTIONING AS A TRANSCRIPTIONAL ANTITERMINATOR.

THIS IS A RNA-BINDING PROTEIN THAT RECOGNIZES A SPECIFIC SEQUENCE LOCATED JUST UPSTREAM OF TWO TERMINATION SITES WITHIN THE OPERON.

-: PTW. PHOSPHORYLATED AND INACTIVATED BY BGLF (II-BGL). THE DEGREE OF PHOSPHORYLATED AND INACTIVATED BY BGLF (II-BGL). THE DEGREE OF PHOSPHORYLATED SHICK ASSENCE OF BETA-GLUCOSIDES WHICH ACT AS INDUCERS OF THE OPERON EXPRESSION.

ADDITION OF INDUCER RESULT IN THE RAPID DEPHOSPHORYLATION OF BGLG.

-: SAUMLARAITY: BELONGS TO THE TRANSCRIPTIONAL ANTITERMINATOR BGLG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   75 ANLPEEQLGALLAGMHTLLQQALRLPPTSLKPDTFRDQLQELCIPQDLYGDLASVVFGSQ 134

Khim. 16:118-120(1990).
-!- FUNCTION: THIS PROTEIN PARTICIPATES IN PROCESSES OF TANNSMISSION AND AMPLETCATION OF THE VISUAL SIGNAL. NECESSARY FOR THE FORMATION OF A FUNCTIONAL PHOSPHODIESTERASE HOLOGNIXME.
-!- CATALYTIC ACTIVITY: GUANOSINE 3',5'-CYCLIC PHOSPHATE + H(2)O = GUANOSINE 5'-PHOSPHATE.
-!- SUBUNIT: OLIGOMER COMPOSED OF TWO CATALYTIC CHAINS (ALPHA AND BETA), AN INHIBITORY CHAIN (GAMMA) AND THE DELTA CHAIN.
-!- SUBCELLULAR LOCATION: MEMBRANE-ASSOCIATED.
-!- SIMILARITY: BELONGS TO THE CYCLIC NUCLEOTIDE PHOSPHODIESTERASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                187 -------AYRFEVPTAKFQELRYSVALVLKEMADLEKR 217

PT N-PSDB: T89027

PT Procuding peptide releasing factor, RF-1 from Streptococcus

Procudiniae - useful for diagnosis and treatment of, e.g. otitis

Procudioniae - useful for diagnosis and treatment of, e.g. otitis

Claim 12; Page 9; 41pp: English.

Completed polypetide relation and pacterial traget. RF-1 can be used to centrate of thishit cell division through a novel regulatory circuit.

Claim 12; Page 9; 41pp: English.

Claim 12; Page 9; Protect the animal from disease.

Claim 12; Page 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S. preumoniae peptide reléasing factor RF-1.

Claim 12; Pages 359-360; 483pp; English.

This sequence represents a Streptococcus pneumoniae protein that, based on homology with a Bacillus subtilis protein, is a peptide chain release factor 1, and is encoded by a DNA sequence of the invention.

The DNA sequences were islandated from Streptococcus pneumoniae strain (100993 (NCIMA 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antagonists can be used to identify compounds which interact inth and invention. They can alsb be used to induce an immunological response of the encoding nucleic acids in a vector adequate to produce antibody and and or I call immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloaritors in particular the proteins of extracellular matrix proteins on in-dwelling devices or in mammalian con progression of pathogenesis in infections initiated other than by the infections in implantation of in-dwelling devices or other than by the inferiors.

New tunorigenesis-associated protein and related nucleic acid,
vectors, transformed cells - antibodies, agonists and antagonists,
for diagnosis, treatment and prevention of abnormal cellular
differentiation, particularly cancers and inflammation

To diagnosis, treatment and prevention of abnormal cellular
differentiation, particularly cancers and inflammation.

This is the amino acid sequence of the human tumourigenesis
associated protein (WTMP), used in the method of the invention. HTMP,
as involved with cell proliferation and inflammation. It can be used
to stimulate cell proliferation (e.g. of cells intended for
to stimulate cell proliferation (e.g. of cells intended for
transplantation in treatment of tumours or infections, or to treat
genetic defects). Antagonists of HTMP are used to treat or prevent
a wide range of cancers (adenocarcinoma, melanoma, sarcoma, lymphoma,
leukaemia etc.), also inflammation where associated with infection or
amunological disease (e.g. asthma, cystic fibrosis, rheumatoid
arthitis). HTMP is also used to raise antibodies are used as for
diagnosis or monitoring of HTMP-related diseases (in usual
immunoassays), in competitive drug screens and to isolate HTMP-related
diseases; to identify related sequences; for genomic mapping and for
standard amplification or hybridisation tests to diagnose HTMP-related
diseases; to identify related sequences; for genomic mapping and for
screening for specific inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ώ

preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 101 polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, Alzheimer's and cognitive disorders, schizophrenia, prostate disease, skeletal or cardiac muscle disorders, pulmonary disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      transplant rejection, disorders involving osteoclasts such as osteoprosis, arthritis or malignancies, digestive/endocrine disorders, infections and AIDS. The human secreted proteins of the invention are represented in Y07852-Y07993 and the encoding nucleic acids are
                                                                                                                                                                                                                                                                                                                                                                             New isolated human genes and the secreted polypeptides they encode Claim 1b; Page 285-286; 368pp; English.
This invention describes novel isolated human genes and the secrete proteins they encode. The products of the invention are useful for
                                                                                                                                                                                                                                                                            Carter KC, Duan DR, Endress GA, Feng P, Ferrie AM, Florence KA, Greene JM, Janat F, Lafleur DW, Ni J, Rosen CA, Ruben SM, Shi Y, Young P, Yu G;

This sequence corresponds to a plasmodium falciparum strain K1

This sequence corresponds to a plasmodium falciparum strain K1

This sequence corresponds to a plasmodium falciparum strain T996

This sequence was isolated by screening a P. falciparum strain T996

Ibrary with serum from a missionary treated by prophylaxis (for strain T6/96 see F89101286). Of 20 clones isolated, clone 795 was used to creen a library generated from Thai strain K1. One clone contained a Screen a library generated from Thai strain K1. One clone contained a Screen a library generated from Thai strain K1.

Screen a library generated from Thai strain K1. One clone contained a Screen a library generated from Thai strain K1.

Screen a library generated from Thoseks of tecrapeptide repeats

(a 95 kb insert including the genomic sequence T78867. The gene comprises (a precially the amino acid sequence VEES, VEEN, VEEN, VAPY, etc.)

and a 3' hydrophobic region corresponding to a glycosyl-phosphatidyl-
colypeptides of at least 10 amino acids derived from the LSA-3 protein

with the exception of the peptides W34791-4. The LSA-3 protein

with the exception of the peptides W34791-4. The LSA-3 protein

performance in detergent formulations, maying improved wash performance in detergent formulations (claim 52, Page -: 104pp; English.

The present sequence represents a variant of a wild-type Pseudomonas pseudoalcaligenes lipase. The variant lipase has have better wash performance than the original lipase. It has improved removal of lipid stains, reduced calcium dependence, better compatibility with detergents or their components, increased hydrophobicity, altered substrate specificity and better one-cycle wash efficiency. The variant lipase is used in detergent and cleaning compositions.

In a sequence does not appear in the specification; it was created using information provided. 73 ASANLSEERLAVLLAGTHTLLQQALRLPPASLKPDAFQEELQELGIPQDLIGDLASL--- 130 74 AISGKGKVNLVGHSHGGPTVRYVAAVRPDLVASV----TSVGAPHKGSDTADFIRQI- 127 127 PPGSAGEAIVAGIVNGLGALINFLSGSSSTS-------PQNALGALESLKSE 171 130 ---AFGSQRP--LLDSVAQQGGSSLPHVSYFRWRVDVAISTSAQSRSLQPSVLM--QLKL 182 39; Gaps 15 ADSHSGRVSFLG-SQPSPEVTAVAQLLKDLDRSTFRKLLKLVVGALH-GKDCREAVEQLG 72 amino acid /note= "Leu optionally replaced with Ile of DB 1; Length 289 /label= 12681 /note= "Leu optionally replaced with Ile" /label- D2728 /note- "Asp optionally replaced with Ser" 275 /note= "Val optionally replaced with Pro" /label= \$224T /note= "Ser optionally replaced with Thr" Ala" /label= #242R /note= "His optionally replaced with Arg" Met. /note= "Asp optionally replaced with Asn" /label= T275S /note= "Thr optionally replaced with Ser" 286 Indels Variants of lipse from Pseudomonas containing specific substitutions - deletions or additions, having improved /label= D229G /note= "Asp optionally replaced with /label= P231A /note= "Pro optionally replaced with /label- K245M /note- "Lys optionally replaced with 75; Query Match 7.4%; Score 82.5; D Best Local Similarity 26.3%; Pred. The full-length provital genomic sequence of retrovitus RFB-14 has been determined. The virus codes for an osteoinductive protein. although the precise location of the coding region has not yet been identified. The virus may be useful in gene therapy of bone growth disorders such as osteoporosis. The present sequence is that of the viral pol gene product.
This protein comprises the CopB outer membrane protein of Moraxella catarrhalis strain 012E, encoded by an isolated copB gene (see V65360). CopB represents an important antigenic determinant of M. catarrhalis, and a specific epitope (see W46250-51) has been identified in the non-conserved region 1 of strains 012E and 035E that is bound by monoclonal antibody 10F3. Claimed peptides (see W46274-81) of this region can be used in the diagnosis, treatment and prophylaxis (as vaccines) of M. catarrhalis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    89 THTLLQQALRLPPASLKPDAFQEELQELGIPQDLIGDLASLAFGSQRPLLDSV-----

Claim 7(b); page 38; 64pp; English.

Monomer of an N-terminal dimer of Mullerian inhibiting substance
They are made by cleaving between Arg-Ser in the sequence
agrsag. The dimers are used to treat cancer,

Sep. female genital tract cancer, and for contraception. See also:
N90395 and P90475-8.

Compsn. comprising human Mullerian Inhibiting substance - useful ror treating cancer. esp. ovarian cancer.

Claim 1; Columns 7-8; 41pp; English.

The insert of bovine MIS cDNA clone p521 was used to isolate the human MIS gene from a cosmid library. The sequence of the encoded mature human MIS protein is given in R76502.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      10-APR-1991 (first entry)
Sequence encoded by human mullerian inhibiting substance (MIS) gene
in cosmid clone chmis33.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example: Fig 6: 39pp; English.

Bovine MIS protein from bovine testes was purified and the AA sequence of several fragments detd. Based on these protein sequences, several antisense oligonucleotide DNA probes were synthesised. The probes were then used to screen a bovine (DNA 11brary. The insert of one bovine MJS cDNA clone (pS21) was used to isolate the human MIS gene from a human cosmid library and partial cDNA clone from a human cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               29 PSPEVTAVAQLL---KDLDRSTFRKLLKLVV----GALHGKDCREAVEQLGASANLSEER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the

Disclosure; Fig.6a-6k; 41pp; English.
The insert of bovine MIS cDNA clone p521 was used to isolate the human MIS gene from a cosmid library. The DNA can be operatively linked to expression control sequences and used in mammalian or sequence 560 AA;

The Bacillus subtilis chromosomal DNA region comprises the srfA claim 15, Page 27-34; 70pp; English.

The Bacillus subtilis chromosomal DNA region comprises the srfA operon which encodes the multienzyme complex surfactin synthetase coding for proteins, a zone upstream of the first ORF contg. the stafA operon promoter and a presumed terminator positioned downstream of the stop codon of the fourth ORF. ORF1 encodes a protein cart homology of ca. 1000 bases, more marked in the second half of internal homology of ca. 1000 bases, more marked in the second half of these regions. At the C terminal end of module 3 there is a region through ORF1 codes for a protein of unknown function, regions of the protein are found to be highly homlogous to synthetases coded by TycA and OrSA (tyrocidin and gramicidin synthetase subunits 1) and with complements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2279 IKELDGELPVLTLPTDYSRPAVQTFEGDRIAF -- SLEAAKADALRRLAKETDSTLYMVLL 2336

R88019-R88025 are protein variants of Pseudomonas pseudoalcaligenes r88019-R88025 are protein variants of Pseudomonas pseudoalcaligenes in page of the sequences are based upon the wild-type P. pseudoalcaligenes sequence disclosed in w09402617-4 (Gist-Erocades). The lipses variants can pe modified in a such amino acid substitutions indicated in the features table. Using these variants it was shown that lipases can be modified in a such a way that interaction with the substrate can be improved without forming large hydrophobic areas on the modified lipase surface which allow aggregation of lipase molecules. The lipase variants show improved in-the-wash lipolytic activity and may sequence 289 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
 02-AUG-1996 (first entry)
Mature Pseudomonas pseudoalcaligenes lipase L210R variant.
Mutant; lipase; enzymatic detergent; substitution; variant; improved;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                73 ASANLSEERLAVLLAGTHTLLQQALRLPPASLKPDAFQEELQELGIPQDLIGDLASL--- 130
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  127 PPYSAGEARVAGIVNGLGALINFLSGSSSTS------PQNALGALESLNSE 171

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                    1112

Patent No. 5648464
GENERAL INFORMATION:
APPLICANT: Artavanis-Tsakonas, Spyridon et al.
TITLE OF INVENTION: Human No. 5648464ch And Delta, Binding Domains
TITLE OF INVENTION: In Toporythmic Proteins, And Methods Based Thereon NUMBER OF SEQUENCES: 34
CORRESPONDENCE ADDRESS:
ADDRESSE: Pennle & Edmonds
STREET: 1155 Avenue of the Americas
CITY: New York
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      55 VVGALHGKDCREAVEQLGASANLSEERLAVL--LAGTHTLLQQALRLPPASLKPDAFQEE 112

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CT863 hypothetical protein - Chlamydia pneumoniae (strain CWL029)
C;Species: Chlamydia pneumoniae
C;Species: Chlamydia pneumoniae
C;Date: 23-Apr.1999 #sequence_revision 23-Apr.1999 #text_change 08-Oct-1999
C;Accession: D7207;
C;Accession: D7207;
C;Accession: D7207;
Natchan, S.; Mitchell, W.; Marathe, R.; Lammel, C.; Fan, J.; Olinger, L.; Grimwood, Nature Genet. 21, 385-389, 1999
A;Title: Comparative genomes of Clamydia pneumoniae and C. trachomatis.
